

## Bug Tracker - Requirements

- Track bugs, feature requests, etc for a project.
- Tracking involves identifying a particular issue with a system, categorizing it, assigning it to a developer, timing the issue.
- Identifying a bug will be done by either a PM, a developer, or tester (anyone not on the team) using either a basic or advanced interface depending on role.
- Categorization will be simple: either as a bug which prevents the system from operating as it was intended or agreed upon, or as a feature request which is new functionality or a modification of a properly functioning mechanism in the system. A priority level will also be assigned.
- The PM will be able to assign bugs to developers or dismiss them if they are not to be implemented (more likely for feature requests).
